Impetigo

Summary

- A highly contagious skin infection that causes red sores on the face.
- Impetigo mainly affects infants and children.
- The main symptom is red sores that form around the nose and mouth. The sores rupture, ooze for a few days, then form a yellow - brown crust.
- Antibiotics shorten the infection and can help prevent spread to others.

Symptoms

- Impetigo sores can appear anywhere on the body, but children tend to get them on their face. Sometimes they show up on their arms or legs.
